## Catching 2 different xmlhttp.responseText in one time

How would I catch 2 responses (in echo) from my Php with xmlhttp.responseText?

My php sends this back:

```
echo "error1";  
echo "error2";
```

Now I need to catch these 2 echos and basicly 'split' them so I can do this for example

```
document.getElementById("errorDIV").innerHTML=xmlhttp.responseText;  
document.getElementById("ERROR2DIV").innerHTML=xmlhttp.responseText2;
```

So errorDIV becomes the text "error1" and ERROR2DIV becomes the text "error2".

How would I do this?

Thanks in advance.

You should modify the output of your PHP script so that it includes a delimiter, eg.:

```
echo "error1";  
echo " || ";  
echo "error2";
```

Now on the client side you can split the responsetext into a javascript array:

```
var responseArray = xmlhttp.responseText.split("||");  
document.getElementById("errorDIV").innerHTML=responseArray[0];  
document.getElementById("ERROR2DIV").innerHTML=responseArray[1];
```

There are cleaner ways, you might want to learn how to output JSON in PHP and how to use the output in JavaScript.

Yeah was already thinking this would be the case, thanks! – [user2911924](#) Jan 3 '14 at 14:58
